

Assignment 2A Approach

Dylan DiTucci-Cappiello

Task

I will create a database directly in postgresSQL that holds information about movie ratings from my friends, family, and coworkers. I will create a google form to survey them and then create the database from the associated CSV file. The data fields will be reviewer, movie title, and rating.

Challenges

I have had minimal experience using SQL queries. The extent of my working knowledge is a simple SELECT, FROM, WHERE query that I've used to create sets of housing data to analyze at work. I anticipate some syntax errors at the very least. I do have a mentor at work who is a Data Systems Manager for the Housing Choice Voucher program. I'm sure she will be more than happy to lend a hand if I need it.
